

## Is Online Data Backup secure?

Definitely. Neo Solutions provides three layers of security to protect your data throughout the remote data storage process. First, all of your data is 128-bit encrypted and compressed on your computer. Next, your compressed encrypted data is sent through a secure SSL channel to Neo Solutions' remote server. Which means when your backup files travel through a public network (internet), eavesdroppers have no knowledge of what has been exchanged. Finally, encryption and decryption is only done on your machine with your password, which will not be transmitted during uploading and downloading. Therefore, nobody, not even the technicians at Neo Solutions, can read the files.
